

AWS Static Website Hosting

Services: Amazon S3, CloudFront, AWS Certificate Manager, Route 53

How it works

Visitor (browser) → Route 53 (A/AAAA alias) → CloudFront (HTTPS + TLS cert) → Amazon S3 (website files)

1. Create the S3 bucket

- Go to Amazon S3 → Buckets → Create bucket.
- Region: Asia Pacific (Mumbai) ap-south-1.
- Bucket type: General purpose.
- Namespace: Account Regional namespace (recommended).
- Bucket name prefix: website-hosting.
- Click Create bucket.

2. Verify the bucket

- Confirm it appears under General purpose buckets.

3. Upload the website files

- Open the bucket and upload index.html, style.css, profile.webp and nikhil resume.pdf.

4. Enable bucket versioning

- Properties → Bucket Versioning → Edit → Enable → Save changes.

5. Request a public certificate (ACM)

- Go to AWS Certificate Manager → Request certificate → Request public certificate.
- Domain name: nikhildange.shop.
- Allow export: Disable export.
- Click Request.

6. Certificate issued

- The certificate status should show Issued.

7. Validate the certificate

- In the certificate details (region us-east-1, used by CloudFront), validate the domain with a CNAME record using Create records in Route 53.
- Domain status should be Success and certificate status Issued.

8. Create the CloudFront distribution

- Distribution name: web-hosting (Standard).
- Status: Enabled.
- Origin: the S3 bucket.

The screenshot shows the AWS CloudFront console in the 'Distributions' section. The left sidebar contains navigation links for CloudFront, Distributions, Policies, Functions, Static IPs, VPC origins, SaaS, Telemetry, and Reports & analytics. The main content area displays 'Distributions (1)' with a table of distributions. A single distribution is listed with ID 'ER032LP44IOVP', Status 'Enabled', Type 'Standard', Domain 'd3it0...', Origin 'nikhildange.sho', website-hosting, Pay-as-you-go pricing, and a creation date of September...

ID	Status	Description	Type	Domain	Alternate Domain	Origins	Pricing	Last Modified
ER032LP44IOVP	Enabled	-	Standard	d3it0...	nikhildange.sho	website-hosting	Pay-as-yo...	Septembe...

9. CloudFront settings

- Distribution domain name: d3it06vo32zjf2.cloudfront.net
- Alternate domain name: nikhildange.shop
- Custom SSL certificate: nikhildange.shop
- Default root object: index.html
- Price class: Use all edge locations (best performance)
- Security policy: TLSv1.3_2025
- HTTP versions: HTTP/2, HTTP/1.1, HTTP/1.0

The screenshot displays the AWS CloudFront console interface. The left sidebar shows the navigation menu with categories like CloudFront, SaaS, Telemetry, and Reports & analytics. The main content area is titled 'web-hosting' and includes a 'Standard' label and a 'View metrics' button. Below this, the 'Details' section shows the distribution domain name 'd3it06vo32zjf2.cloudfront.net', the ARN 'arn:aws:cloudfront:123865824:172:distribution/ER032LP44IOVP', and the last modified date 'September 23, 2026 at 4:18:27 PM UTC'. The 'Settings' section is divided into three columns: 'Name' (web-hosting), 'Description' (empty), and 'Price class' (Use all edge locations (best performance)). The 'Alternate domain names' section shows 'nikhildange.shop' with a 'Route domains to CloudFront' button. The 'Custom SSL certificate' section shows 'nikhildange.shop' with a checkmark. The 'Supported HTTP versions' section shows 'HTTP/2, HTTP/1.1, HTTP/1.0'. The 'Standard logging' section shows 'Off'. The 'Cookie logging' section shows 'Off'. The 'Default root object' section shows 'index.html'. The 'Security policy' section shows 'TLSv1.3_2025'. The 'Cache tag header' section shows '-'. The bottom of the console shows the footer with copyright information and links to Privacy, Terms, and Cookie preferences.

10. Configure Route 53 records

- In the hosted zone nikhildange.shop, create A and AAAA alias records pointing to the CloudFront distribution (d3it06vo32zjf2.cloudfront.net).
- The zone also keeps the default NS and SOA records.

11. Test the website

- Open <https://nikhildange.shop>.
- The site should load and the browser should show "Connection is secure".
